SYNCRO 2

SYNCRO 2 is a new selector (INDEX) shift lever from Campagnolo. It is compatible with different types of freewheels and derailleurs and also offers the user the choice of friction or selector (INDEX) shifting.

With SYNCRO 2 the second lever of the original SYNCRO has been eliminated. The resulting simplification of internal components makes assembly simpler and faster.

The shifting precision of SYNCRO 2 has been enhanced with the use of a double detent system to insure a positive engagement of the micrometric insert.

The inserts are fully interchangeable with those of the original SYNCRO and are available for various combinations of derailleurs and freewheels (see table below).

With SYNCRO 2 changing from selector mode to friction mode couldn't be simpler, just pull out the knurled washer next to the wing nut and rotate it 90° clockwise.

That's it. And just like the original SYNCRO, the friction is fully adjustable for the rider's personal needs.

To insure durability, Campagnolo has manufactured the toothed insert from a special steel specifically selected to ensure the inalterability of the materials shape, even after prolonged use.

The profile of the teeth within the insert has been computer designed in order to obtain the optimum performance relationship between cable tension, cable housing, derailleur parallelogram and cage plate return springs.

The reliability of the mechanism has been tested and verified through Campagnolo's rigorous testing facilities, subjecting the SYNCRO shift lever mechanism to hundreds of thousands of shifts.
